Correspondence Analysis Examples

Smoke data example

STAT 32950-24620

Spring 2023 (4/13)

1/32

3/32

Cell percentages

 $\sum_{i,j} p_{ij} = 1$, where

$$p_{ij}=\frac{x_{ij}}{n}, \qquad i=1,\cdots,I; \ j=1,\cdots,J$$

X = as.matrix(smoke); #sum(X) # 193

P = X/sum(X); round(P,2) # cell percent table

Contingency table

Contingency tables:

Display the cell counts $(n_{ij} \text{ or } x_{ij})$ of the row and column variables.

Example

Employee smoke status

library(ca); data(smoke); smoke

none light medium heavy
SM 4 2 3 2
JM 4 3 7 4

```

5/32

Expected values under independence

$$E_{ij} = nr_i c_j = \frac{x_{i \bullet} x_{\bullet j}}{n} = \frac{n_{i \bullet} n_{\bullet j}}{n}, \qquad i = 1, \cdots, I; \ j = 1, \cdots, J.$$

where

$$x_{i\bullet} = \sum_{i=1}^{J} x_{ij} = \sum_{i=1}^{J} n_{ij}, \qquad x_{\bullet j} = \sum_{i=1}^{I} x_{ij}$$

are the row sum and column sum.

E = smokerow%*%smokecol/193 # expected counts under indep.
round(E,1)

Column profile matrix

$$P_c = \left[\frac{p_{ij}}{c_j}\right] = \left[\frac{n_{ij}}{n_{ullet}j}\right] = PD_c^{-1}$$

Column profile matrix (column sum = 1) for comparing columns

smokecol = c(1,1,1,1,1)%*%X # col sum 61 45 62 25 round(X%*%diag(c(1/smokecol)),2)

6/32

Test of independence

Assuming the $n = I \times J$ observations are independent.

 H_o : The row variable and the column variable are independent.

Under H_o , the test statistic (sometime written as X^2)

$$\sum_{i=1}^{J} \sum_{j=1}^{J} \frac{(x_{ij} - E_{ij})^2}{E_{ij}}$$

is of χ^2 distribution with degrees of freedom df=(I-1)(J-1)

Chi-square test

chisq.test(smoke) #16.442, df = 12, p-value = 0.1718

##

Pearson's Chi-squared test

##

data: smoke

X-squared = 16, df = 12, p-value = 0.2

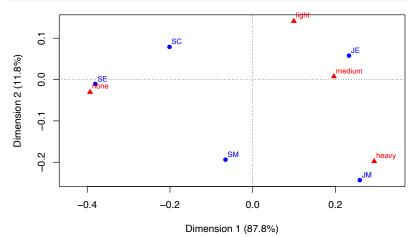

Total "inertia"
$$\frac{X^2}{n} = \frac{16.442}{193} = 0.085$$

9 / 32

11/32

Graphical representation by CA

plot(ca(smoke), map="symmetric") # default of (ca(smoke))

Cell level contributions

Individual cell contributions to the chi-square test statistic:

$$\frac{(x_{ij}-E_{ij})^2}{E_{ij}}$$

round((smoke-E)^2/E,2)

CA derivations

The chi-square statistic (divided by overall counts = total inertia)

$$\sum_{i=1}^{J} \sum_{j=1}^{J} \frac{(x_{ij} - E_{ij})^2}{E_{ij}} = trace(SS^T) = \sum_{k} \lambda_k^2$$

where λ_k 's are singular values of the $I \times J$ matrix

$$S = D_r^{-1/2} (P - rc^T) D_c^{-1/2}$$

$$D_r = diag\{r_1, \dots, r_I\}, \qquad D_c = diag\{c_1, \dots, c_J\}$$

are $I \times I$ and $J \times J$ diagonal matrices,

$$r = [r_1 \cdots r_l]', \qquad c = [c_1 \cdots c_l]'$$

are vectors of length I and J respectively. Recall

$$P = [p_{ij}], \ p_{ij} = \frac{x_{ij}}{n}, \ r_i = \sum_{j=1}^{J} p_{ij}, \ c_j = \sum_{i=1}^{I} p_{ij}, \ i = 1, \dots, I; \ j = 1, \dots, J$$

Verify CA derivations

```
# Verify by hand
Drow=diag(c(sqrt(smokerow/sum(X))))
Dcol=diag(c(sqrt(smokecol/sum(X))))
S = solve(Drow)%*%(as.matrix(smoke-E)/193)%*%solve(Dcol))
